Picture	Tools	Link/ Command	POC	Analysis
Ocean.jpg	exiftool	https://exif.tools/		Demonstrates that browser-based metadata viewers offer a convenient alternative for extracting embedded information without a CLI environment.
		exiftool ocean.jpg		Successfully retrieved the hidden flag located within the image's "Comment" metadata field, proving how often sensitive data is overlooked in standard tags.

Computer.jpg	Hexeditor	https://hexed.it/		Facilitates real-time inspection of the raw byte structure and file signatures through a cloud-based interface.
		hexeditor computer.jpg		Verified the file's true identity by cross-referencing its magic bytes (header) against known file signature databases.
dog.jpg	binwalk	binwalk dog.jpg binwalk -e dog.jpg cd _dog.jpg.extracted/	 	Leveraged signature scanning to identify and extract nested file systems or hidden data payloads embedded within the original image.
computer.jpg	strings	https://www.dcode.fr/strings-extractor		Used a web-based extractor to quickly filter out noise and isolate sequences of printable characters from the binary blob.

		strings computer.jpg		Effectively parsed the binary file to reveal human-readable strings, which is essential for identifying hardcoded keys or developer notes.
solitaire.exe	file	file solitaire.exe		Confirmed a classic "file extension spoofing" technique, where an executable extension was used to mask a standard PNG image.
rubiks.jpg	file	file rubiks.jpg		Identified that the file was mislabeled as a JPEG, as the internal data structure corresponds strictly to the Portable Network Graphics (PNG) format.
